

# ELOTECH

## R2200S

**Multi-Zone Temperature Controller with Service-Interface**

**4 | 6 | 8 | 16 zone 2-point controller**

**4 | 8 zone 3-point controller**

Designed for DIN rail mounting acc. EN 50 022

### Description and operating manual

# 2 General Information

The controllers of the series R2200S are designed for mounting in a control cabinet. They do not have an operating panel.

By the integrated Fieldbus Interface all process- and configuration parameters can be accessed. For simplifying the initiation and configuration, the free configuration tool ELOVISION-2 is available at [www.elotech.de](http://www.elotech.de). With this tool the controller can be configured without programming the Fieldbus Master for this purpose.

In case of parameters set by text identification, the numerical value which has to be transmitted by the Fieldbus, is declared in parentheses in this manual.

The description of the parameters in this manual refers to the readouts in ELOVISION-2. For further information see chapter "Service-Interface".

Used symbols:

|                         |   |
|-------------------------|---|
| <b>Switch behav. A1</b> | Font for texts as displayed in ELOVISION-2  |
| <b>&lt;S&gt;</b>        | Symbolizes the value of the factory adjustment of the respective parameters.  |
| <b>&gt;3&lt;</b>        | This parameter is available in 3-point controllers only.  |
| <b>( 2 )</b>            | This numerical value relates to the corresponding text and must be transmitted by the Fieldbus. The text <b>0EF</b> relates to the smallest numerical value allowed reduced by 1. |

### 3 Installation Instructions

Make certain that the device is used for the intended purpose only.

The devices are designed for DIN rail mounting acc. EN 50 022.

Protect the device against impermissible humidity and contamination.

Ambient temperature may not exceed 50 °C (122 °F).

Electrical connections must be made according to valid regulations and by properly qualified personnel.

If using thermocouple sensors, compensation lines have to be connected directly to the controller terminals. Sensors may be connected only in compliance with the programmed range.

Sensor cables and signal lines (e.g. logic or linear voltage outputs) must be laid separately from control lines and mains voltage supply cables (power cables).

It is not permitted to connect the grounds of the sensor-inputs and Logic-outputs with each other.

Separate installation of controller and inductive loads is recommended.

Interference from contactor coils must be suppressed by connecting adapted RC-combinations parallel to the coils.

Control circuits (e.g. for contactors) should not be connected to the mains power supply terminals of the controller.

The configuration parameters are generally to be selected first.

#### Disclaimer of Liability

We have checked the contents of this document for conformity with the hardware and software described. Nevertheless, we are unable to preclude the possibility of deviations so that we are unable to assume warranty for full compliance. However, the information given in the publication is reviewed regularly. Necessary amendments are incorporated in the following editions.

We would be pleased to receive any improvement proposals which you may have.

The information contained herein is subject to change without notice.

Electronic scrap and components are subject to special treatment and must be disposed of by authorized companies.

# 4 Type Code

R2200 - aaa - s - y - 000 - d - z

| Power Supply |         |
|--------------|---------|
| 1            | 230 VAC |
| 2            | 115 VAC |
| 3            | 24 VAC  |
| 5            | 24 VDC  |

| Fieldbus Interface |             |
|--------------------|-------------|
| 0                  | No          |
| 2                  | RS 232      |
| 4                  | RS 485      |
| 5                  | 0/20mA TTY  |
| 7                  | CAN         |

|     | Zones    | Type        | Control Outputs heating / cooling |       |
|-----|----------|-------------|-----------------------------------|-------|
| 421 | 4-zones  | two-point   | Relay                             |       |
| 426 | 4-zones  | two-point   | Logic                             |       |
| 431 | 4-zones  | three-point | Relay                             | Relay |
| 436 | 4-zones  | three-point | Logic                             | Logic |
| 437 | 4-zones  | three-point | Logic                             | Relay |
| 621 | 6-zones  | two-point   | Relay                             |       |
| 626 | 6-zones  | two-point   | Logic                             |       |
| 821 | 8-zones  | two-point   | Relay                             |       |
| 826 | 8-zones  | two-point   | Logic                             |       |
| 836 | 8-zones  | three-point | Logic                             | Logic |
| E26 | 16-zones | two-point   | Logic                             |       |

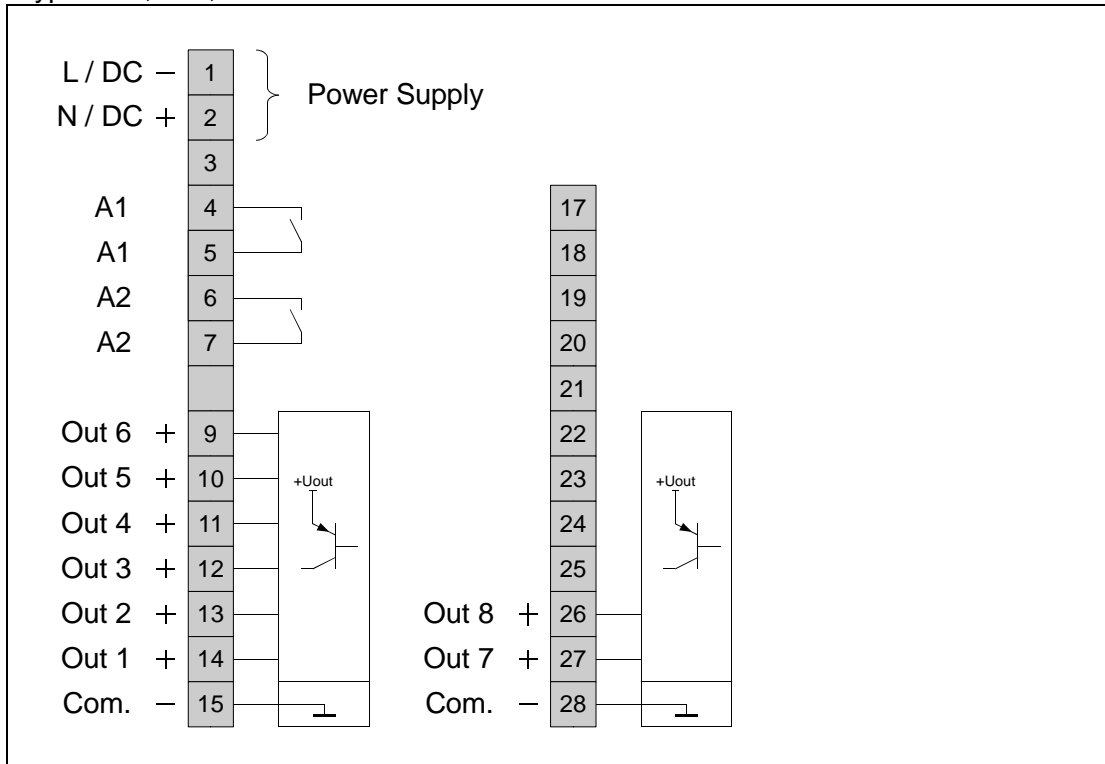

# 5 Connection Diagram

## 5.1 Power Supply and Outputs

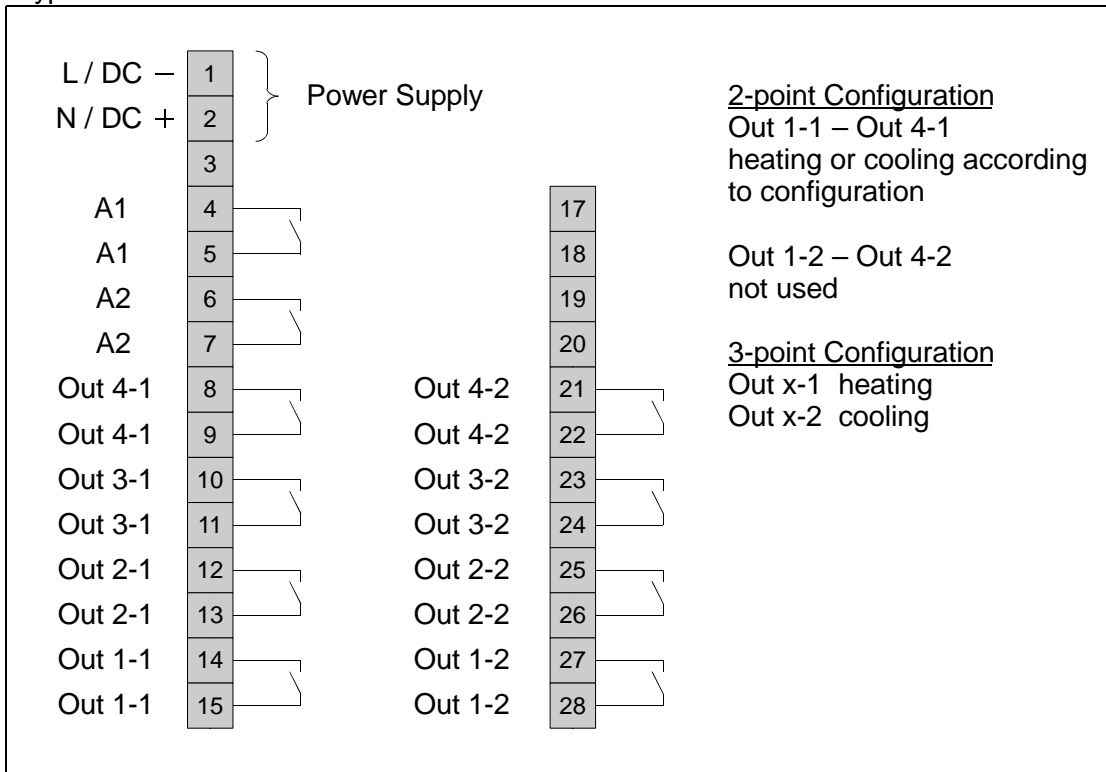

Type: 421, 621, 821

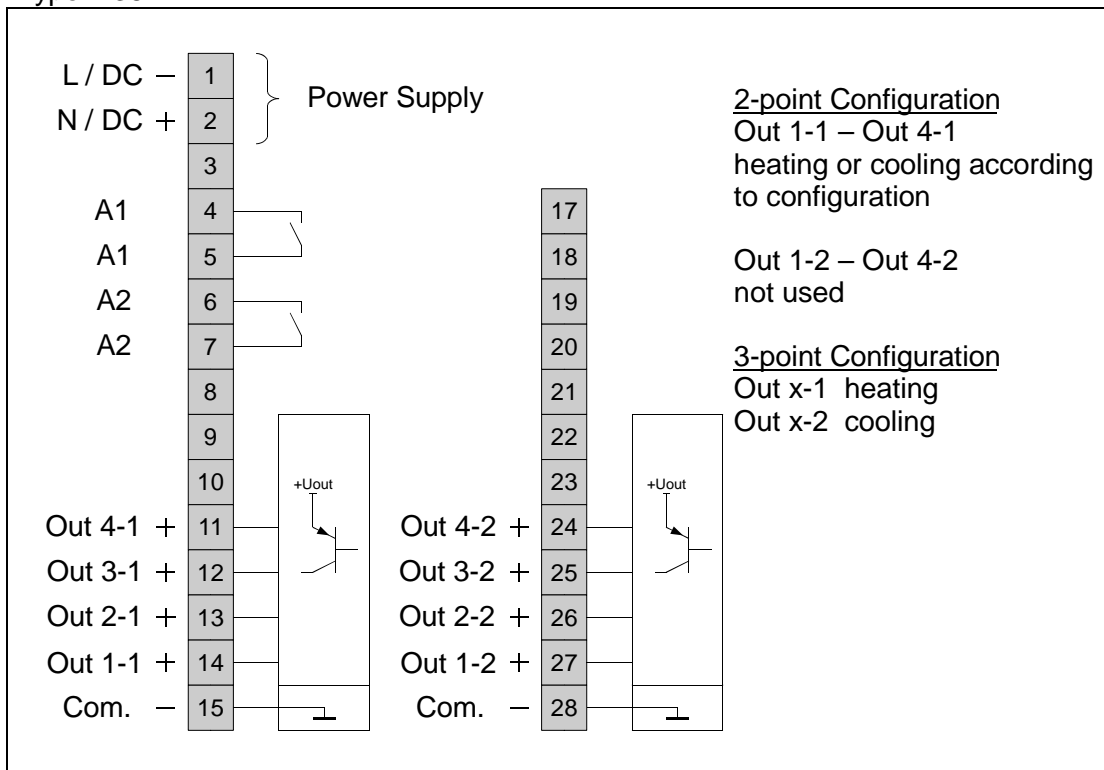

Type: 426, 626, 826

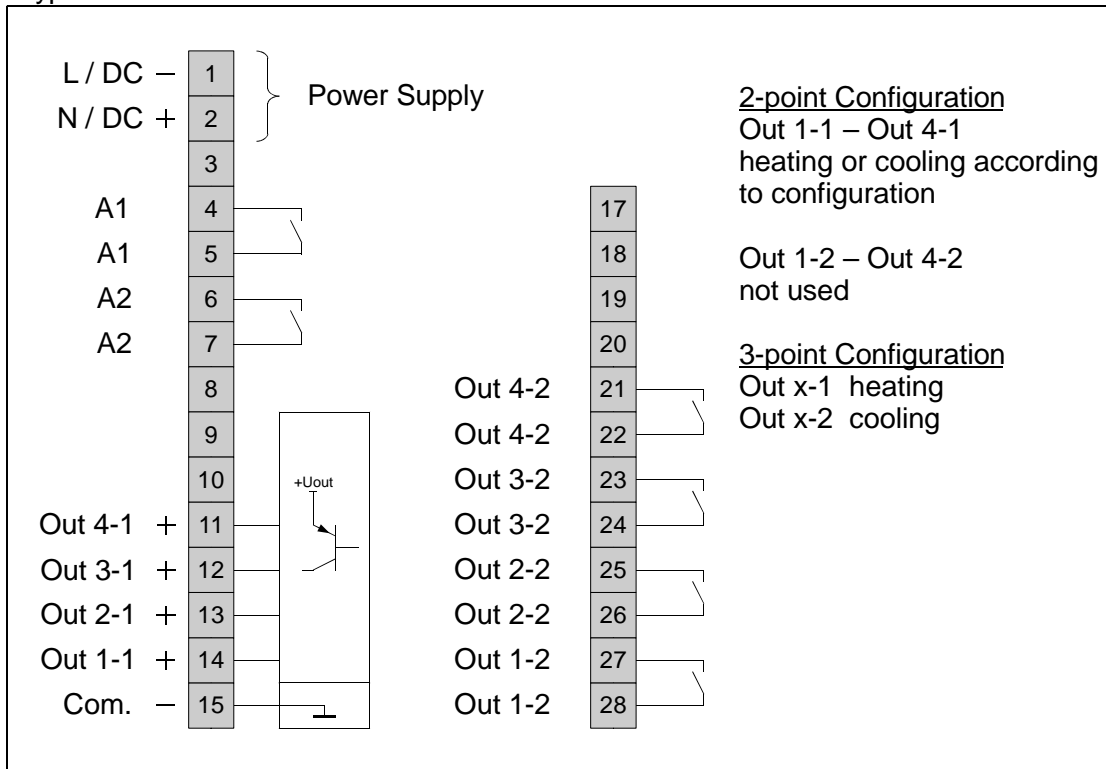

Type: 431

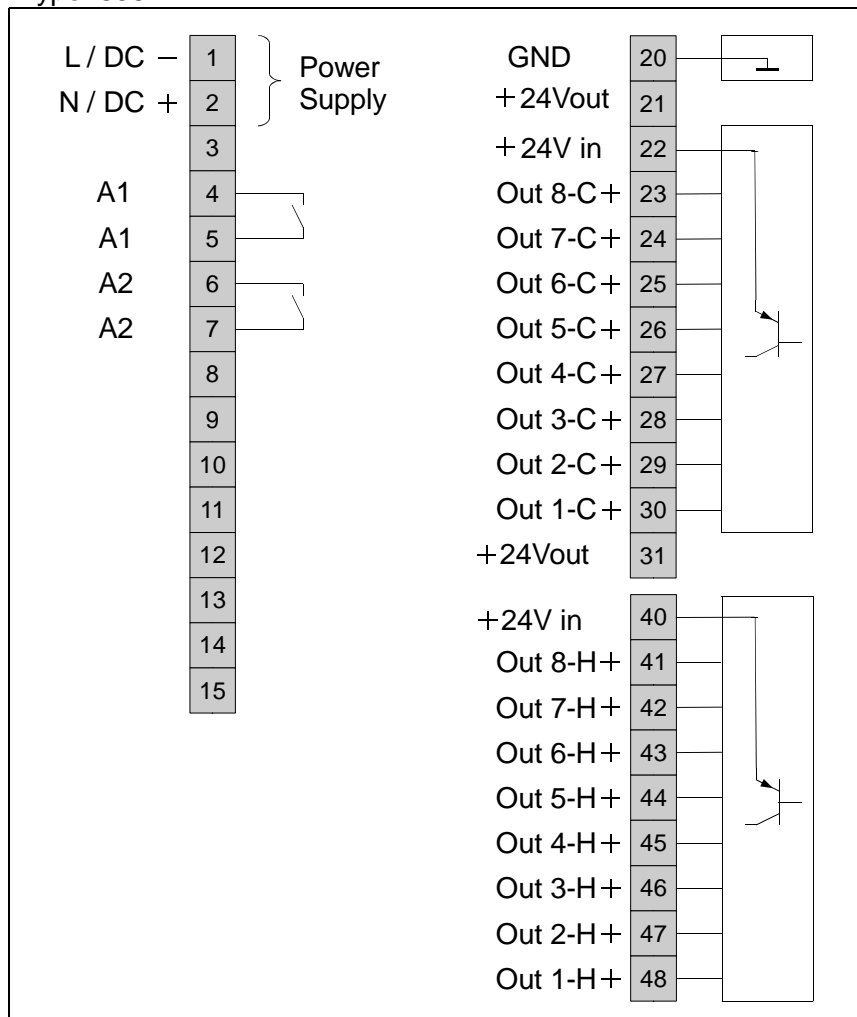

Type: 436

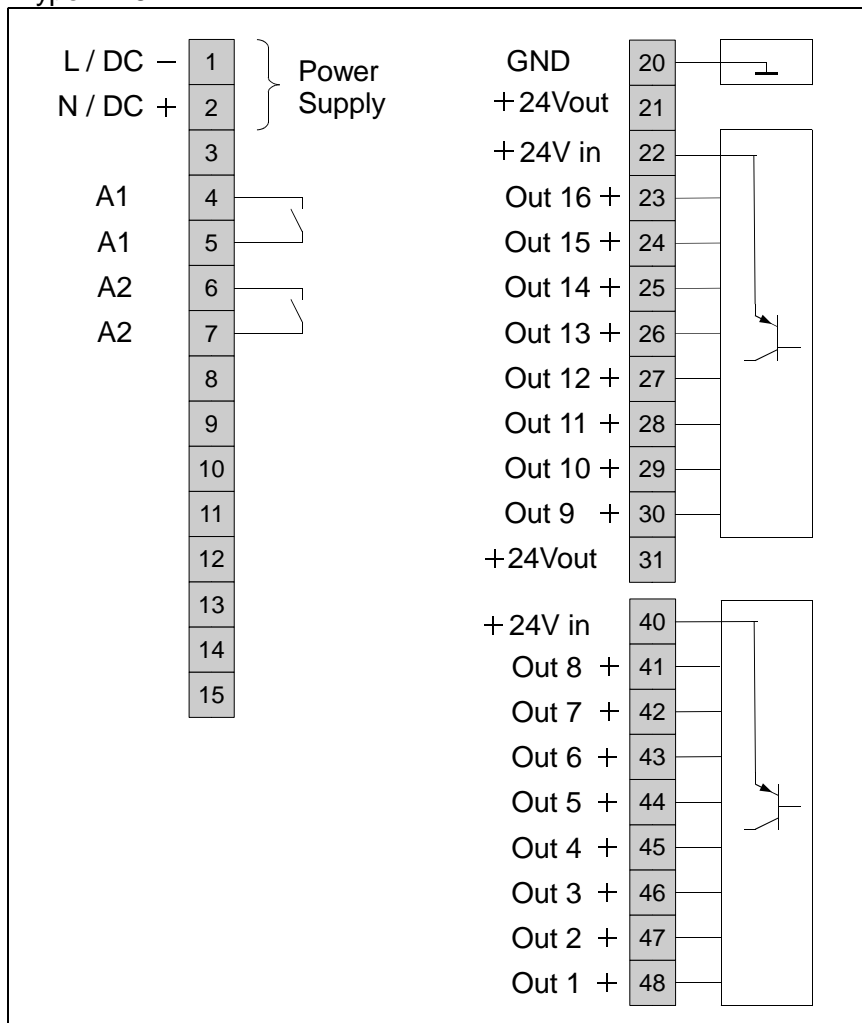

Type: 437

Type: 836

Type: E26

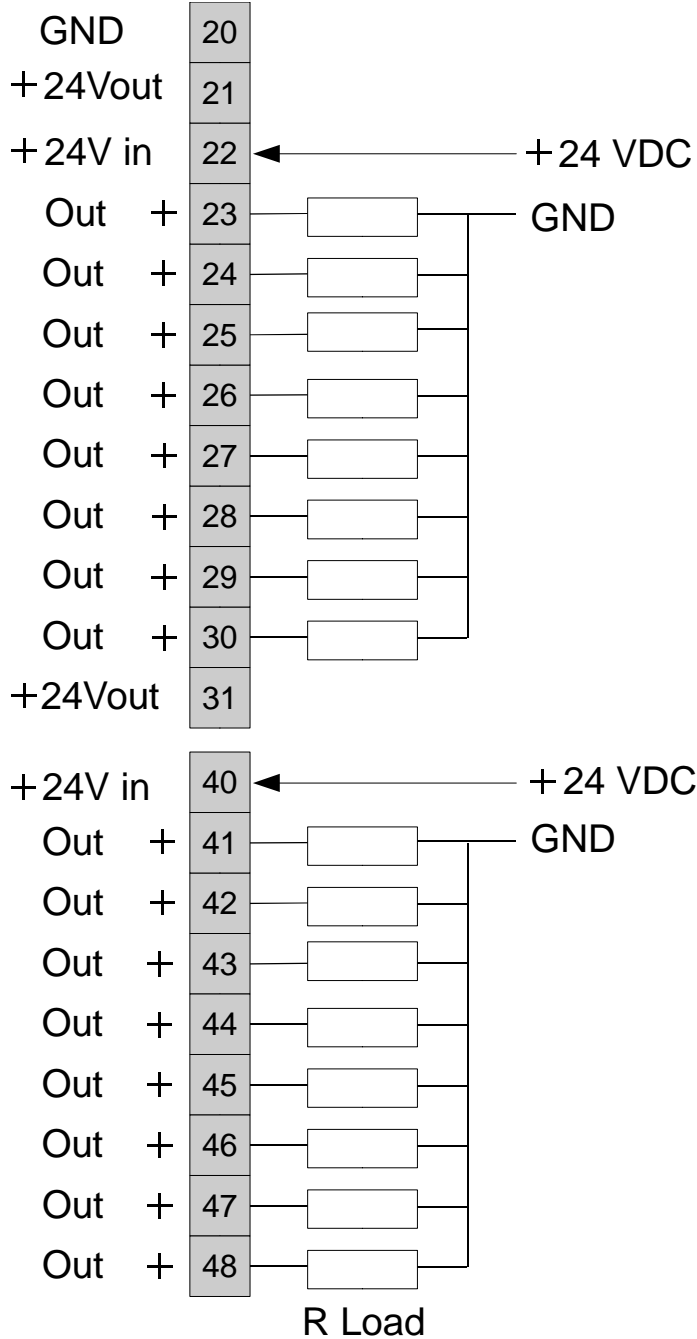

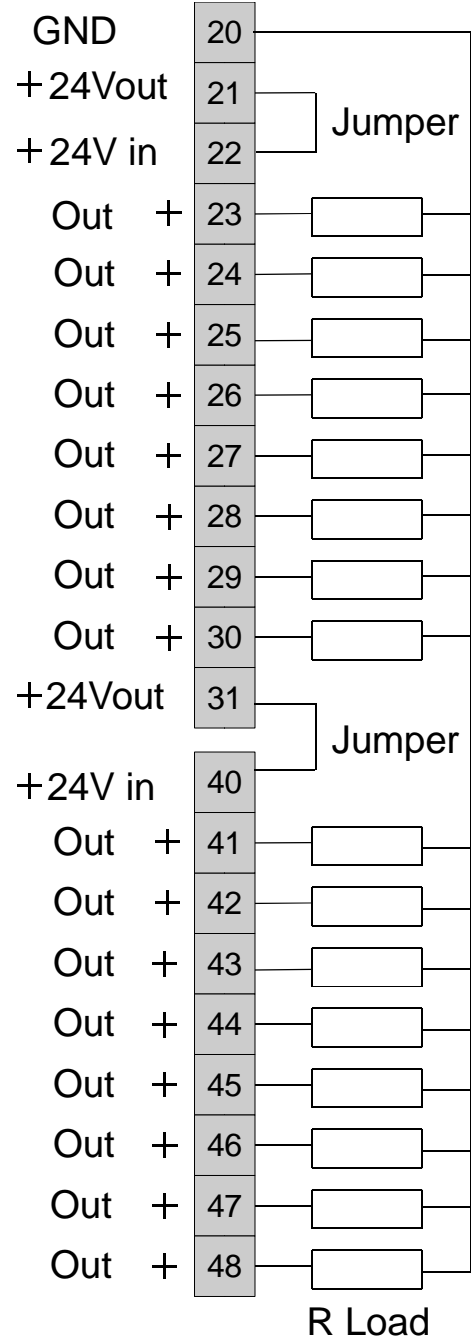

## 5.2 Connection Hints for Outputs Type 836 and E26

These types are equipped with galvanically isolated outputs.

Power supply with external voltage 24V DC  
Galvanic isolation possible.

Power supply with internal voltage 24V  
Galvanic isolation impossible.

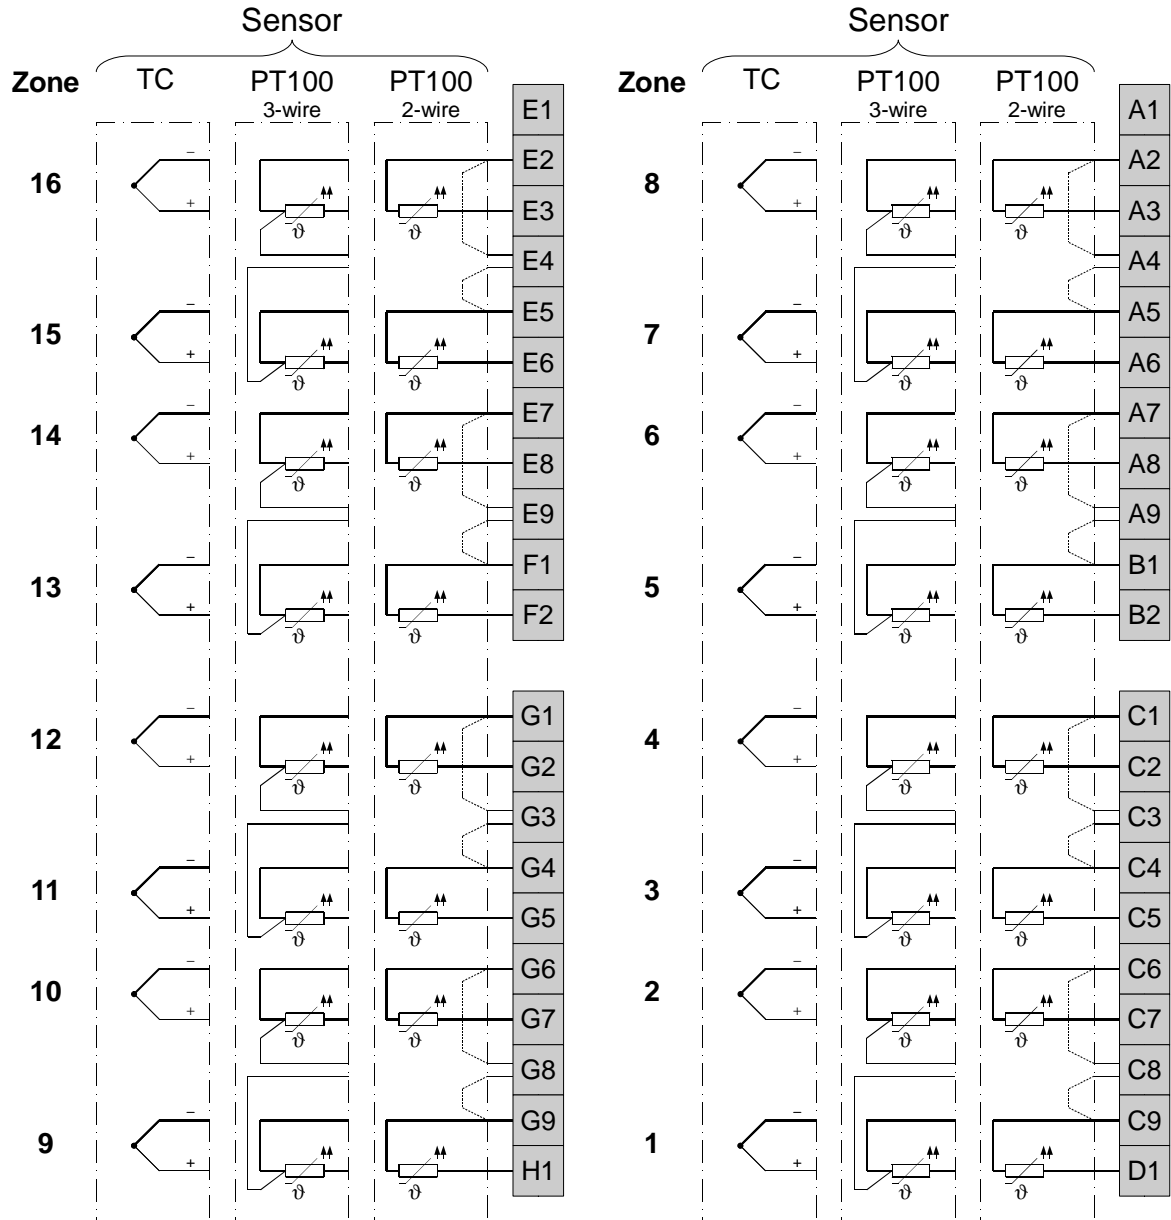

## 5.3 Sensor Inputs

Type: 421, 426, 431, 436, 437, 621, 626, 821, 826,

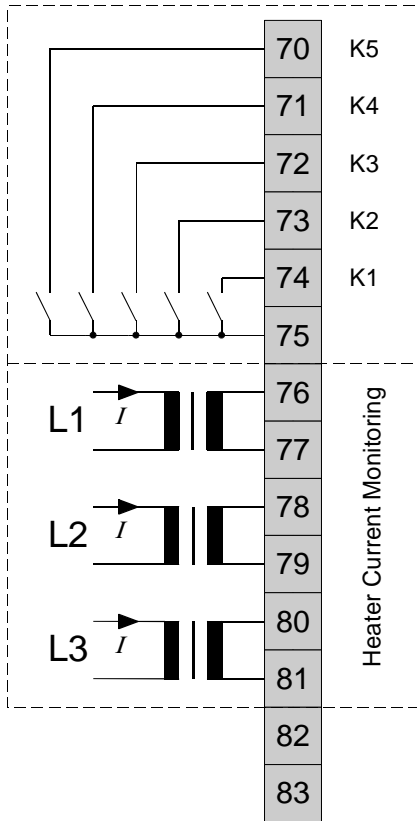

It is not permitted to connect the grounds of the sensor-inputs and Logic-outputs with each other.

It is not permitted to connect the grounds of the sensor-inputs and Logic-outputs with each other.

## 5.4 Additional Functions

Setpoint Controlling:

|    |        |                                      |
|----|--------|--------------------------------------|
| K1 | open   | Setpoint 1 (SP1) valid for all zones |
|    | closed | Setpoint 2 (SP2) valid for all zones |

CAN-Interface:

|    |        |   |
|----|--------|---|
| K4 | open   | CAN: „operational“ only by CANopen protocol |
|    | closed | CAN: „operational“ always active            |

The contacts K2, K3, K5 are not used and must not be connected.

## 5.5 Fieldbus Interfaces

| Profibus                 | CAN | RS 485 | RS 232  | 0/20mA  |    |
|--------------------------|-----|--------|---------|---------|----|
| GND                      |     |        | GND     | GND     | 90 |
| VP +5V                   |     |        | RxD out | RxD in  | 91 |
| CNTR                     |     |        | TxD in  | RxD out | 92 |
| RxTx P                   | H   | A      | TxD out | TxD out | 93 |
| RxTx N                   | L   | B      | RxD in  | TxD in  | 94 |
| Service-Interface RS 485 |     |        |         | A       | 95 |
|                          |     |        |         | B       | 96 |

# 6 DIP-Switches and LED-Displays

## 6.1 Devices with Serial Interface

- POWER ●
- RUN ●
- BUS ●
- ERROR ●

Meaning of the LEDs

|              |            |                                |
|--------------|------------|--------------------------------|
| <b>POWER</b> | ON         | Supply voltage is applied.     |
| <b>RUN</b>   | BLINKING   | Device is in operation.        |
| <b>BUS</b>   | FLICKERING | Interface is active.           |
| <b>ERROR</b> | BLINKING   | System error, check parameters |
|              | ON         | System error                   |

Adjustment of the DIP-Switches:

| 1,8                                 | 1,4                                 | 1,2                                 | 1,1                                 | 2,8                                 | 2,4                                 | 2,2                                 | 2,1                                 | <input type="checkbox"/> =OFF <input checked="" type="checkbox"/> =ON |

| X                | BLINKING  | System error, check parameters.     |
| OFF              | OFF       | Profibus: No connection             |
| BLINKING         | OFF       | Profibus: Wait for Parameterization |
| ON               | OFF       | Profibus: Data Exchange             |
| alternating 10Hz |           | Invalid adjustment of DIP-switches  |
| alternating 1Hz  |           | System error Profibus-Hardware      |

Adjustment of the DIP-Switches:

| 1,8 | 1,4 | 1,2 | 1,1 | 2,8 | 2,4 | 2,2 | 2,1 | =OFF | =ON          |
|-----|-----|-----|-----|-----|-----|-----|-----|------|--------------|
|     |     |     |     |     |     |     |     |      |              |
|     |     |     |     |     |     |     |     |      | Address: 1   |
|     |     |     |     |     |     |     |     |      | Address: 2   |
|     |     |     |     |     |     |     |     |      | Address: 3   |
|     |     |     |     |     |     |     |     |      | ...          |
|     |     |     |     |     |     |     |     |      | Address: 125 |
|     |     |     |     |     |     |     |     |      | Not allowed  |
|     |     |     |     |     |     |     |     |      | Not allowed  |

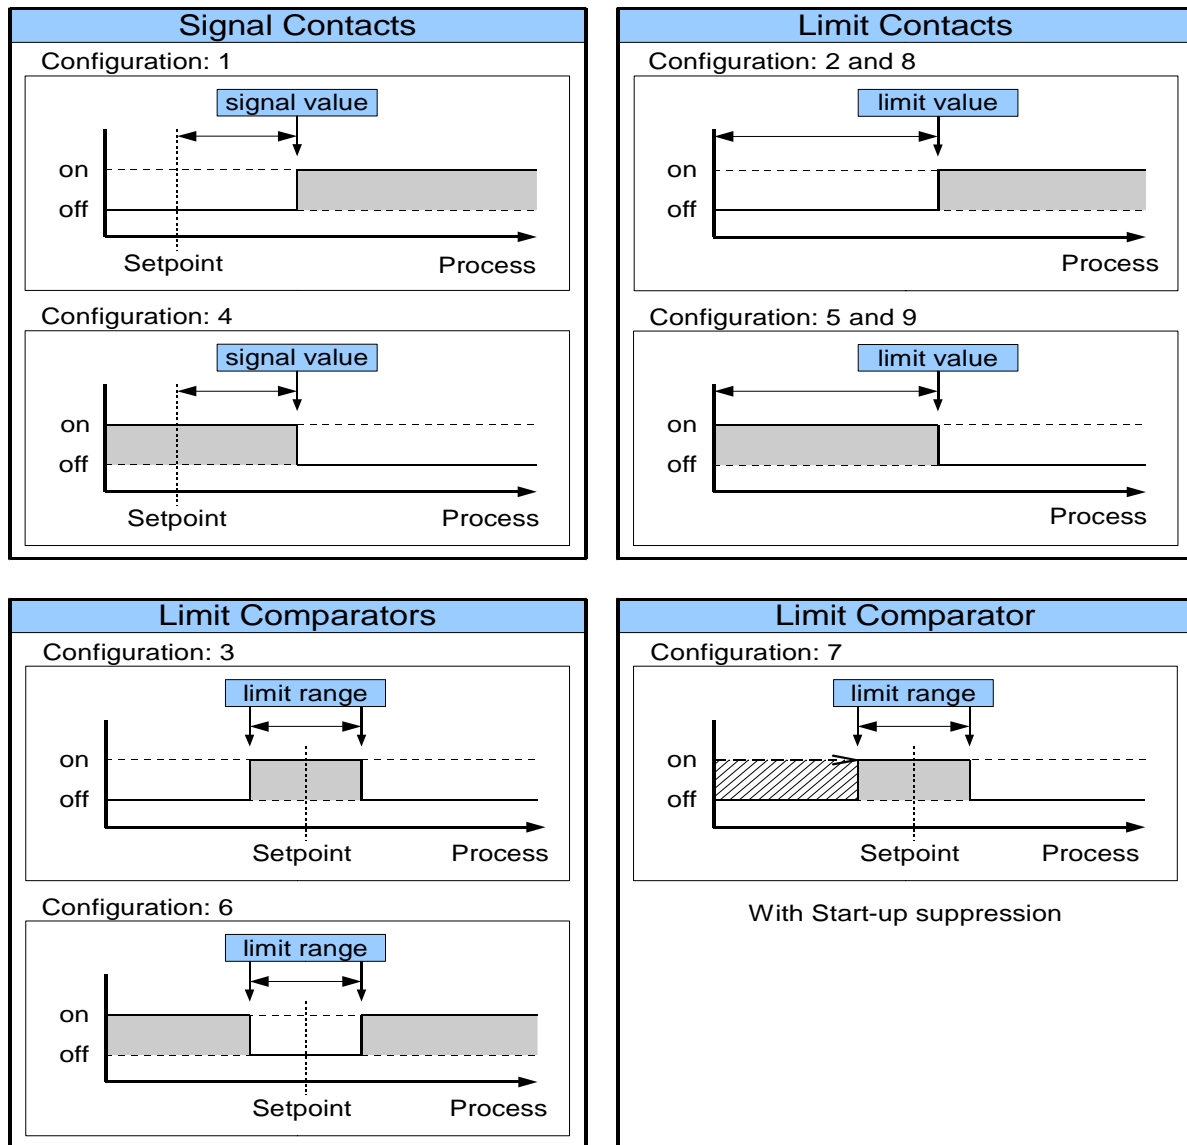

DIP 1,8 must always be set to OFF.

## Alarm configurations, general information:

The controller features two independent alarms with one corresponding alarm relay each.

Each alarm contact works as a common alarm for all zones. The individual alarms A1 (A2) of all zones are connected to the common contact A1 (A2). The selected configuration is valid for all active zones

### Please note:

Care should be taken to ensure that the setpoints of the alarm contacts are programmed within the selected measuring range.

If a setpoint ramp has been programmed, the alarms that are relative to the setpoint (signal contact, limit comparator) follow the setpoint ramp.

In case of sensor error the alarms react in the same way as range override.

The alarm contacts therefore do not offer protection against all types of plant breakdown.

We recommend the use of a second, independent monitoring unit.

The different alarm configurations define the working mode of the alarm. If the controller features a heater current monitoring, two additional heater current alarms are available. The actual alarm values have to be set in the menu "Control Parameters".

|  |   |
|--|---|

| <b>Switch behav. A2</b><br>Relay switching behaviour         | Identical adjustment as <b>Switch behav. A1</b>   |

## Heater current monitoring (option)

The heater current monitoring function is valid for all connected zones.  
The following parameters are displayed when the alarm configuration is programmed to "heater current" (8 or 9).

The alarm value (heater current value) is programmed as an absolute value.

Please note: Ensure that the limit value is set correctly to avoid false alarms in case supply voltage changes. The alarm can be delayed by selecting a "Delay time".

The heater current measuring is designed for a current transformer 1:1000.  
(ELOTECH type: M2000)

Heater current detection and indication range:

0...max. 60,0 A Single-phase operation

0...max. 99,9 A Three-phase operation

The sum of all three phases currents is monitored.

## Serial Interface (RS232, RS485 or TTY)

The controllers of the series **R2200S** can be equipped with a serial interface **RS232, RS485** or **0/20mA** (half-duplex) as an option.

This enables a master (PLC) to set and to read the process- and configuration parameters. The communication is always controlled by the master. The controller operates as a slave. If there are transmission or range errors detected by the slave, the message is not accepted and the existing parameter values remain valid.

The LED "BUS" on the front panel indicates the activity of data communication.

Protocol descriptions and further information: Please see [www.elotech.de/downloads](http://www.elotech.de/downloads)

The following parameters are adjusted by DIP-switches exclusively. **The values can be read, but not be modified by ELOVISION-2.**

|                         |  |

## Profibus Interface

The following parameters are visible if the device is equipped with a Profibus-DP-interface (option).

This enables a master (PLC) to set and to read the process- and configuration parameters. The communication is always controlled by the master. The controller operates as a slave. If there are transmission or range errors detected by the slave, the message is not accepted and the existing parameter values remain valid.

The LED "BUS" on the front panel indicates the state of the Profibus Interface.

By Profibus all process values and configuration parameters can be read at any time.

Protocol descriptions and further information: Please see [www.elotech.de/downloads](http://www.elotech.de/downloads)

The following parameters are adjusted by DIP-switches exclusively. **The values can be read, but not be modified by ELOVISION-2.**

|-----------------------|---|
| <b>Device address</b> | 1... 125<br>At this address a master communicates with the controller.<br>Each controller requires a unique address |
|-----------------------|---|

## CANopen Interface

The following parameters are visible if the device is equipped with a CANopen interface. (option)

This enables a master (PLC) to set and to read the process- and configuration parameters.

The LED "BUS" on the front panel indicates the activity of data communication.

The control operation will start when the controller is set into "operational mode" by the CANopen-master. In this case the keyboard is locked.

For control operation without CAN-interface close contact K4.

**Note:** A CAN-network has to be terminated on both ends with terminating resistors (120 Ohm).

|                       |                       |                         |

## 7.2 Control Parameters, Zone Dependent

|                   |  |
|-------------------|--|
| <b>Setpoint 1</b> | Programming range:<br>Setpointlimit min..Setpointlimit max <b>&lt;§ = 0°C&gt;</b>  |
| <b>Setpoint 2</b> | off <b>&lt;§&gt;</b> , Setpointlimit min..Setpointlimit max<br>If the external contact K1 is closed, the setpoint becomes active in all zones in which Setpoint 2 is not set to "off". |

### Ramp function:

A programmed ramp is always activated when the setpoint is changed or when the mains supply is switched on. The ramp starts at the actual process value and ends at the preselected setpoint. The ramp can be activated for both setpoint 1 and setpoint 2. By programming the second setpoint accordingly a setpoint profile can be obtained. (Please see example below.)

|                     |                                      |  |

| <b>Max output Ratio</b><br>(heating)      | 0%...100%<§><br>The limitation of the output ratio is only necessary if the heating energy supply is grossly overdimensioned compared to the power required. Under normal conditions a limitation is not necessary (setting = 100%). The limitation becomes effective when the controller's calculated output ratio is greater than the maximum permissible (limited) ratio.<br><b>Warning!</b><br>The output ratio limitation does not work during autotune. |  |

**Adjustment of the control parameters:**

As standard the controller operates in PD/I control mode, i. e. controlling without deviation and with practically no overshoot during start-up.

3-point controllers (marked with: >3<) have a second "cooling" parameter set.

The control action can be altered in its structure by adjusting the following values to the parameters:

- a. no control action, on-off            setting P = off
- b. P-action                                setting D and I = off
- c. PD-action                                setting        I = off
- d. PI-                                         setting        D = off
- e. PD/I                                        modified PID-mode (set: P, D, I)

According to the configuration, certain parameters are not visible.

**Autotune:**

The tuning algorithm determines the characteristic values within the controlled process and calculates the valid feedback parameters ( P,D,I ) and the cycle time ( = 0.3 x D ) of a PD/I-controller for a wide section of the range.

The autotune mode is activated during start-up shortly before the setpoint is reached. If activated after the setpoint has already been reached, the temperature will first drop by approx. 5% of the measuring range in order to detect the exact amplification of the process.

The setpoint must amount to at least 5% of the measuring range.

**Autotune active:** Indication in display "Zone Information": OPT

The tuning algorithm can be activated at any time by selecting the parameter **Autotune = on** . After having calculated the feedback parameters, the controller will lead the process value to the actual setpoint.

Please note: If the softstart function is active, the autotune cannot be activated.

Selecting **Autotune = off** will stop the autotune function.

### Softstart Function in General:

If you select the softstart function, make sure that the instrument is equipped with bistable voltage (logic) outputs. This function is not allowed for instruments with relay outputs. Otherwise the relays will be damaged.

During the softstart the controller's heating output response is limited to a preselected ratio, in order to achieve a slow drying of high performance heat cartridges.

This results in a slower, more regular heating period.

Simultaneously the output clock frequency is quadrupled.

Once the process value reaches the softstart setpoint, it remains stable at this value for the preselected duration time.

At the end of this period the process value rises to the valid setpoint.

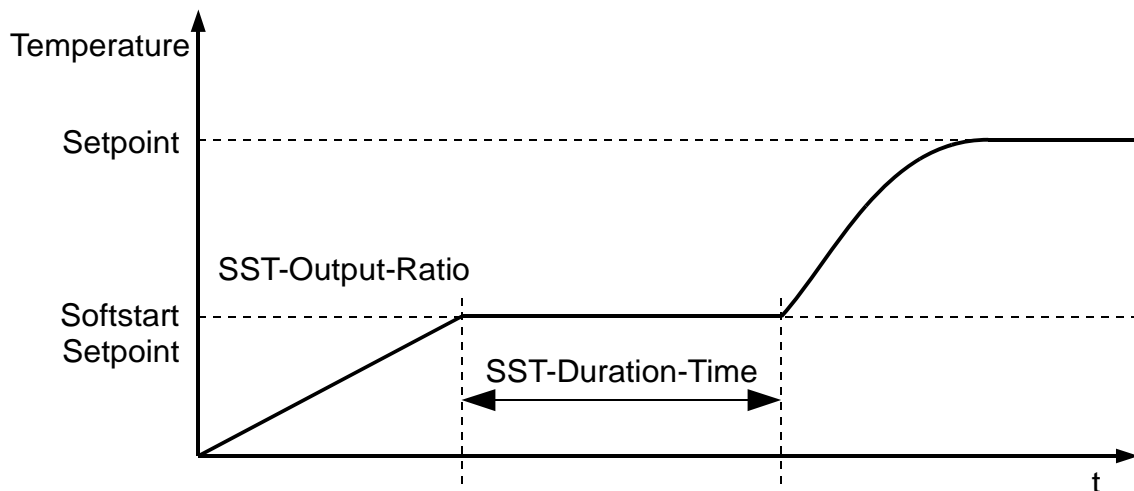

If the softstart is active, the controller's autotune function cannot operate (E.OP).

If a setpoint ramp has been programmed, the softstart has priority, and the ramp will become active after the softstart has been completed.

The softstart only works

- if the parameter P (xp) is programmed  $\geq 0,1\%$
- if the actual process value is lower than the softstart setpoint – 5% of the selected measuring range

It is possible to select this function for each zone individually.

End of the Control Parameters list

## 8 Service-Interface

The multi-zones-controllers **R2200S** are equipped with a serial service interface. It is designed to communicate with the software tool ELOVISION-2 which will allow the user to configure the controller by PC.

The following options are available:

- Read out all controller parameters.
- Modify all parameters.
- Save complete parameter sets on the PC (tool / setup management).
- Load back a setup from the PC to the controller. A once saved configuration can be copied to an unlimited number of controllers.
- Print a setup protocol.
- Visualization of all process values, setpoints and operating conditions

Interface parameters:

- Type: RS485, connection to terminal 95 (A) and 96 (B). A termination resistor (120 ohm) is required on both ends of the line!
- Baudrate: 115.2 kBaud (not adjustable)
- Format: 8 N 1 (not adjustable)
- Device address: Adjustable in the parameter "SERVICE interface: Device address":

When ordering the controller it has to be chosen whether the service interface is activated or not. If not ordered ex works there will be the note "not enabled" visible at the bottom of the screen. For later use of the service interface, it can be activated with the ELOVISION-2 software. Please contact the manufacturer for obtaining a licence key.

## 9 Error Messages

| Error message                | Cause                              | Possible remedy  |
|------------------------------|------------------------------------|--|
| LED <b>ERROR</b><br>BLINKING | Error writing parameters to memory | Check all parameters.<br>Switch device off and on.<br>If the error message continues, please send the controller back to the manufacturer. |
| LED <b>ERROR</b><br>ON       | System error                       | Please send the controller back to the manufacturer.   |

Further LED indications are described in chapter "DIP-Switches and LEDs".

## 10 Technical Data
